Reasons are studied for the formation of the layers of
fibers which build up in the clothing of the cylinder and
flats of a carding machine. The study shows that re-
duced tooth height does not completely prevent the
formation.

Consideration is given to: (1) the computation of
stresses in the sections of a conical shell without taking
into consideration the influence of the restraint; (2) the
analysis of the wing in the region of elastic restraint;
(3) the analysis of a multispar triangular wing; (4) an
